THE 2012 VIRGINIA ASSESSMENT/SALES RATIO STUDY

Introduction

In accordance with Section 207 of Title 58.1 of the <u>Code of Virginia</u>, the Virginia Department of Taxation conducts an annual real property assessment/sales ratio study covering every city and county in the Commonwealth. This report summarizes the results of the 2012 study. The study estimates the existing assessment/sales ratio for each locality by comparing assessed values to the selling prices of bona fide sales of real property. A locality's total fair market value of real estate, divided by its assessment/sales ratio, produces an estimate of the locality's total true (full) value of real estate. The local true values developed in this study are used as a factor in Virginia's basic school aid distribution formula. The study also determines the effective local true tax rates across the State. The effective true tax rate (expressed per \$100 of true value) provides an appropriate means of comparing tax rates on similar properties in different taxing jurisdictions. The study also serves as an element in the determination of assessment levels of public service corporation property in each locality of the State. Finally, the study evaluates the level of uniformity in the assessment of real property within and across jurisdictions of the State.

The 2012 assessment/sales ratios are calculated from a statistical sample of all fair market real estate sales in 2012, with all bona fide sales used in the case of smaller localities. The Department of Taxation allows localities to file all of their real estate transactions directly with the Department in a prescribed format. Approximately 67,583 sales are actually used in this study. For each selected parcel, its assessed value in 2012 is compared to its sale price to calculate an assessment/sales ratio. The best indicator of a locality's overall assessment/sales ratio is the median, or midpoint of the ratios when ordered by value. The median ratio captures the performance of the real estate market; a low median ratio indicates a strong market. However, a median ratio close to or in excess of 100 percent (where assessed values closely approximate sales prices) may indicate that a reassessment has been undertaken recently, or may indicate a weak market.

The study uses standard statistical measures, such as the coefficient of dispersion and the regression index, to examine the level of uniformity in the assessment of real property within and across jurisdictions in Virginia. The coefficient of dispersion is based on the average absolute deviation as recommended by the International Association of Assessing Officers (IAAO). It measures how closely individual ratios are grouped around the median; the smaller the measure of dispersion, the greater the uniformity of the ratios. The regression index compares the treatment of less expensive property with that of more expensive property. It evaluates the relative tax burdens of owners of low and high valued properties. The statistical terms, methodology used for computation, and the sources of data are detailed in the appendices.

Results of the 2012 Study

Median Ratio and Coefficient of Dispersion

Table 1 contains the median assessment/sales ratio, and the coefficient of dispersion for every county and city. Table 1 also shows the total fair market value of real estate, the number of sales in the sample, and the latest year of assessment, which are among the several factors that affect the median ratio and the coefficient of dispersion. Figure 1 indicates that the 2012 median ratio ranges between 80 and 100 percent for 94 of Virginia's 95 counties and 39 of its 39 cities. Figure 2 indicates that the coefficient of dispersion is less than 20 percent in 49 counties and 31 cities, and is less than 10 percent in 16 counties and 13 cities.

In addition to the 31 localities that undertake annual reassessments, 31 other localities (23 counties and 8 cities) had reassessments effective for 2012. Reassessments typically result in higher or lower median ratios as assessed values are brought into line with selling prices. Title 58.1, Sections 3201 and 3259 of the <u>Code of Virginia</u> require that real estate reassessments be at 100 percent of fair market value.

The sample used in this study consists of 67,583 sales, covering six classes of property. Table 2 examines the variation in median ratios across localities for all six classes: (1) single-family residential urban, (2) single-family residential suburban, (3) multi-family residential, (4) commercial/industrial, (5) agricultural/undeveloped 20 -100 acres, (6) agricultural/undeveloped over 100 acres. Sales in the single-family residential urban and suburban classes dominate the total sample, with 43,024 urban and 20,978 suburban property sales. A breakdown of sample points, by locality and property class, is given in Appendix 2.

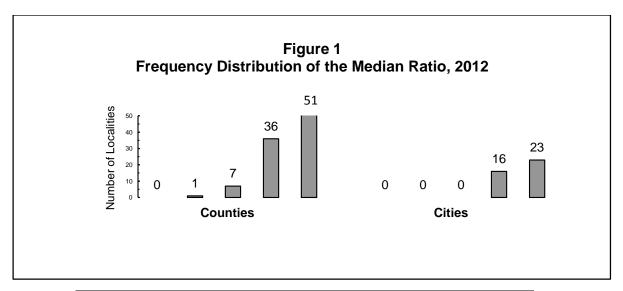

Nominal and Effective Tax Rate

Table 3 provides the nominal and effective true tax rates for 2011 and 2012 for each locality. The median assessment/sales ratio for the state in 2012 was **92.9**%, a slight decrease from 94.5% in 2011. The steps in the computation of the state median ratio are detailed in Appendix 3. The statewide nominal tax rate for 2012 was equal to \$0.9424 per \$100 of assessed value, while the estimated effective tax rate for the state was \$0.8756 per \$100 of true value. Figure 3 shows that the nominal tax rate for 79 of Virginia's 95 counties was less than or between \$0.40 and \$0.79 per \$100 of assessed value. The nominal rate was greater than or equal to \$1.00 per \$100 of assessed value in 18 of the state's 39 cities. Localities' effective true tax rates tend to be somewhat lower than their nominal rates. Effective rates were less than or between \$0.40 and \$0.59 per \$100 of true value for 44 of the 95 counties, and were greater than or equal to \$1.00 per \$100 of true value for 16 of the 39 cities.

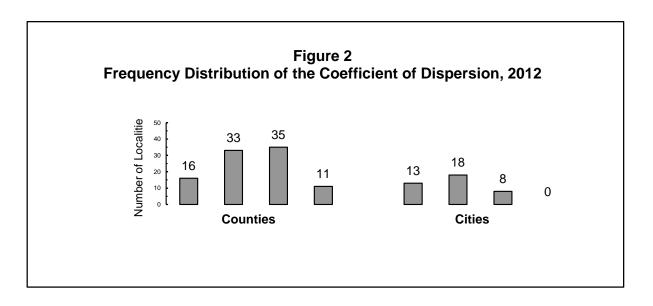

Estimated True Value of Property

Table 4 provides the total estimated true full value of locally taxed property for real estate and public service corporations. The total estimated true value for the state was \$1.072 trillion in 2012, which is approximately 2.3 percent higher than the figure for 2011. The estimated true value of real estate excluding public service corporations (the total fair market value reported in the local land book divided by the median assessment/sales ratio for the locality) was \$1.03 trillion, which is approximately 2.2 percent higher than in 2011. Total estimated true value for public service corporations was \$41.7 billion; that figure includes the value reported by the State Corporation Commission as well as the estimated true value of railroad and interstate pipeline transmission property.

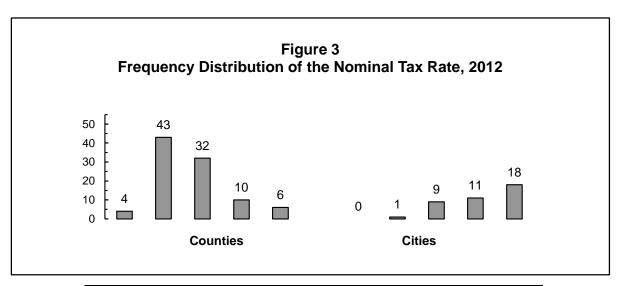

Table 5 provides the per capita estimated true full value of locally taxed property for real estate and public service corporations. Across the State, total estimated true value averaged about \$131,000 per capita. While estimated population in the State increased by about 1.1 percent from 2011 to 2012, the estimated true value per capita increased about 1.2 percent.

^{*}Based on fiscal year 2011-2012.

The estimated true value per capita is the true value of property divided by the 2012 estimate of population reported by the University of Virginia, Weldon Cooper Center for Public Service.

Appendix 1

Methodology and Terms

The Department of Taxation adopted a method of collecting data from the localities in a prescribed format. Localities may include their entire qualifying ("arm's length") population in the Study with minimal cost of data collection to the Department.

The <u>data</u> are derived from the recordation tax receipts that the law requires the Clerk of the Court in each locality to file with the Virginia Department of Taxation. The Department obtains the data on sales prices from the computerized listing of the Supreme Court of Virginia. The listing indicates each transfer, the date of the deed, the name of the grantor and the grantee, the address of the grantee, the quantity of land conveyed, the specified sales price, and a description of the parcel. The Department of Taxation collects information from the field on the assessed values of the property for a sampling of the transactions.

The <u>number of sales</u> selected in the study is determined by the personnel of the Property Tax Unit in consultation with the localities. Only arms length sales are selected from the total number of transfers reported in the land records of a locality.

<u>Fair market sales</u> are defined as "arm's length" transactions where there is a willing buyer and a willing seller, neither of which is under pressure to sell or buy. This excludes transfers such as sales within a family, foreclosures, or sales to a government unit.

The assessed value for each sale is divided by its selling price to produce an assessment/sales ratio. The ratios for each locality are arrayed by numerical value, and the median ratio is selected as the best indicator of that locality's existing assessment/sales ratio. The median ratio is defined as the ratio value where half the ratio values are higher and half the ratio values are lower. The median ratio is unaffected by distortions caused by large sales or "extreme" ratios at either end of the spectrum, particularly those at the higher end. The National Association of Tax Administrators, the U.S. Department of Commerce, and a special committee of the International Association of Assessing Officers (IAAO) recognizes the accuracy of the median ratio. The median ratio for the state is calculated by dividing the state effective tax rate by the nominal tax rate for the state.

The coefficient of dispersion in this report is based on the measure recommended by the IAAO. It is calculated by:

- (1) subtracting the median ratio from each ratio in the sample,
- (2) taking the absolute value of the calculated differences,
- (3) summing the absolute differences,
- (4) dividing by the number of ratios to obtain the "average absolute deviation,"
- (5) dividing by the median ratio, and
- (6) multiplying by 100.

This measure represents the mean percentage deviation from the median ratio. Mathematically, if Xi represents the assessment/sales ratio for the ith sale in a sample of size n, and Xm represents the median ratio of the sample,

Coefficient of Dispersion=[({Sum[Abs(Xi-Xm)]}/n)/Xm]*100

The coefficient of dispersion calculated by this method is affected by the size of the sample (n), that is, the number of sales of property used in the study for a locality. Comparing two localities with the same median ratio and similar spread, the coefficient of one may be larger if it has a smaller sample size. This average absolute deviation method based on all sample data has been used beginning with the 1993 study.

A small coefficient of dispersion indicates that the ratios are grouped relatively close to the median and that assessment of property is more equitable. A large coefficient indicates that there is a wide spread in the ratios around the median, reflecting a less uniform assessment of property. The acceptable level for the coefficient of dispersion depends on the type of property considered and the size of the sample. The IAAO notes that a low coefficient (15 percent or less) tends to be associated with good appraisal uniformity. A coefficient of 15 percent indicates a good distribution of assessments for single-family residential properties. Similarly, a coefficient of 20 percent or less indicates a good distribution for more diverse classes of property. A less uniform assessment translates into inequality in actual tax burdens. As market activity decreases or the complexity of properties increases, the coefficient of dispersion often rises, even though appraisal procedures may be valid. Variation in assessments may be a result, among other things, of the length of period between reassessments, difficulty of obtaining fair market value for different types of parcels, and the unique characteristics of different properties.

<u>Total fair market</u> value includes the value of land, buildings, and improvements, and minerals under the surface, as well as standing timber (trees) not owned by the owners of the land/lot. This information is based on land book records and reported every year to the Department of Taxation by the local Commissioners of the Revenue and assessors. The fair market value for localities refers to **2012**, except for counties and cities that conduct fiscal year reassessments, where the 20**11**-20**12** values are reported.

The <u>regression index</u> is defined as the mean ratio divided by the sales-weighted ratio. The sales-weighted ratio is the total of the assessed values divided by the total of the selling prices of all sales in the classification. It allows transfers with a larger selling price to have a greater impact on the ratio than those with smaller selling prices. A value of 1.00 indicates a uniform relationship between assessed values and selling prices of properties with different prices. An index above 1.00 indicates that less expensive property has a higher assessment/sales ratio than more expensive property. A reasonable index may be in the range of 0.95 to 1.05 percent, but tax experts have not reached a consensus regarding this level.

The <u>nominal tax rate</u> for a locality is the rate of tax per \$100 of assessed value levied for county/city and district purposes. The tax rate is calculated by dividing the real estate levies by the local real estate taxable value, as reported from the local land books by the local Commissioners of the Revenue. Some localities impose additional district levies, so

that the rate is higher than the county levy reported in the <u>Virginia Local Tax Rates Bulletin</u>. The nominal tax rate for the state is obtained by dividing the total local real estate levies by the total taxable real estate value of all counties and cities.

The <u>effective tax rate</u> for a locality is calculated by multiplying the nominal tax rate by the median assessment/sales ratio. The effective tax rate for the state is computed by multiplying the total fair market value for all counties and cities by the state nominal tax rate and then dividing by the total true value of real estate for the state.

The total estimated true value of locally taxed property is composed of two components: real estate and public service corporation property. The estimated true value of real estate is computed as the total fair market value reported in the local land book, divided by the median assessment/sales ratio for the locality. The public service corporation component includes the value reported for each locality annually by the State Corporation Commission plus the estimated true value of railroad and pipelines for each locality as reported by the Railroad and Pipeline Appraisal section of the Property Tax Unit of the Department of Taxation.

The estimated <u>true value per capita</u> of locally taxed property is defined as the true value of property divided by the 20**12** estimates for population as reported to the Department of Taxation by the University of Virginia, Weldon Cooper Center for Public Service.

Appendix 3

Computations for State Median Ratio

1. The nominal tax rate for Virginia is obtained by dividing the total local real estate levies by the total taxable real estate value of all counties and cities.

The local levy and taxable value refer to fiscal year 2011-2012 for the following localities which conducted fiscal year reassessments:

County	<u>City</u>	
Charlotte	Bedford	Manassas Park
Isle of Wight	Buena Vista	Newport News
Mecklenburg	Covington	Norfolk
	Danville	Petersburg
	Franklin City	Poquoson
	Fredericksburg	Portsmouth
	Lexington	Virginia Beach
	Lynchburg	Williamsburg

Data on taxable value and levies for the above localities for Fiscal Year 2011-2012 are from the <u>Virginia Department of Taxation's</u>, <u>Annual Report</u>, <u>Fiscal Year 2012</u>. All other localities conducted calendar year reassessments and the data for those localities are taken from the <u>Annual Report</u>, <u>Fiscal Year 2013</u>.

2. The effective tax rate for the State is computed by multiplying the total fair market value for all counties and cities by the State Nominal Rate of tax and then dividing by the total estimated true value of real estate for the State.

```
State Effective Rate = Total FMV Taxable * Nom. Tax Rate / Tot.True Value of R.Est.
= (957,153,428,100 * 0.9424) / 1,030,151,547,196
= $0.8756 per $100 of True Value
```

3. The median ratio for the State is calculated by dividing the State Effective Rate by the State Nominal Rate.

State Median Ratio = State Effective Tax Rate / State Nominal Tax Rate

= .8756 / .9424

State Median Ratio = 92.9%
